

# Business Requirement Document

## 1 Business Objective

To implement a centralized, workflow-driven escalation management system that captures multi-channel customer escalations, enforces structured RCA and CAPA, ensures SLA-based closures with auto-escalation, and provides real-time dashboards with automatic learning integration.

## 2 Current Pain Points

- Centralized repository for escalations currently maintained manually in Excel

| Sr. | Project | Type | Priority | Issue Raised on | Zone | Issue details | Notes | Closure status | Action taken | CBE date | Link to Mail Trail | Escalation Closure Date | Time Elapsed |
|-----|---------|------|----------|-----------------|------|---------------|-------|----------------|--------------|----------|--------------------|-------------------------|--------------|
|     |         |      |          |                 |      |               |       | (Open/ Closed) |              |          |                    |                         |              |

- No automated trackers
- Inconsistent investigation formats / RCA across zones
- No real-time visibility to management
- Delays due to lack of automated escalation triggers

## 3 Success Criteria

- 100% escalations captured digitally
- RCA mandatory before closure
- Minimizing delays
- Real-time management dashboard availability

## 4 Process Flow

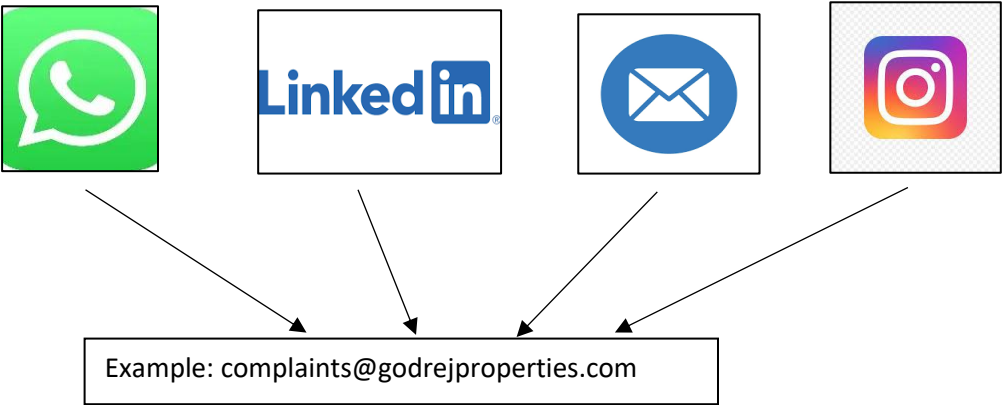

### Phase 1

- Sources of Escalations**

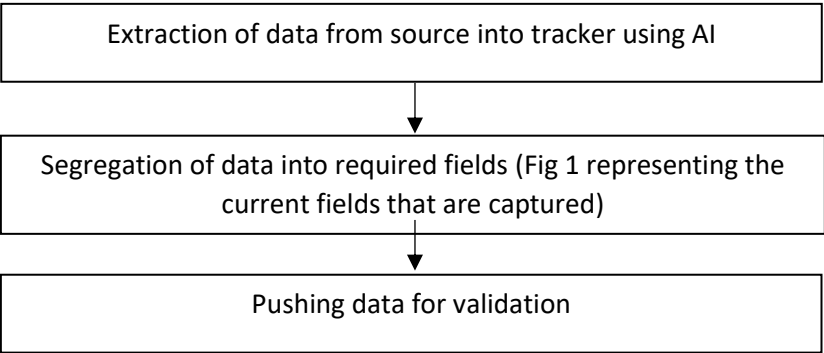

Customer escalations are received through multiple channels, including LinkedIn, whatsapp, and direct emails to senior leadership (Chairman, CEO, CQO, etc.). As these interactions often involve multiple stakeholders within a single communication thread, it is important to effectively interpret context, consolidate inputs, and accurately understand the issue.

- Centralised Escalation Management system

All customer escalations are routed to a single, dedicated complaint handling platform (e.g., a common email ID such as complaints@godrejproperties.com) to ensure uniform intake and tracking. The system acts as a unified repository, consolidating complaints received from multiple channels including social media, emails to leadership, and other touchpoints.

- Data Segregation & Standardisation

The system leverages AI to automatically extract relevant information from incoming customer communications and convert unstructured data into a structured format within the tracker. Key details that are being captured at present are listed below.

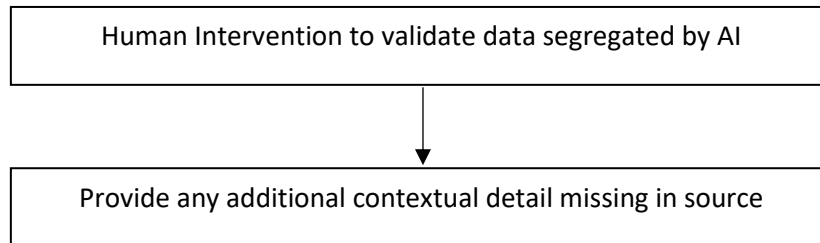

| Sr. | Project | Type | Priority | Issue Raised on | Zone | Issue details | Notes |
|-----|---------|------|----------|-----------------|------|---------------|-------|
|-----|---------|------|----------|-----------------|------|---------------|-------|

(Fig 1)

It should also assign priority levels (Fatal, Critical, Medium, Low) to each complaint based on keyword identification and contextual analysis—for instance, terms such as “legal” or

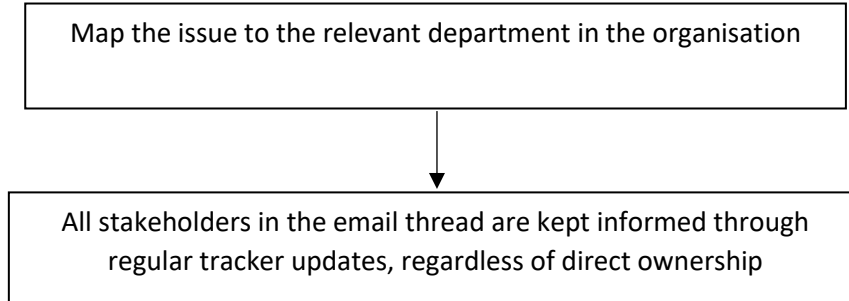

“hazard” trigger high priority, while routine issues like “maintenance” are categorized as lower priority.

- **Human intervention (validation of AI segregated data)**

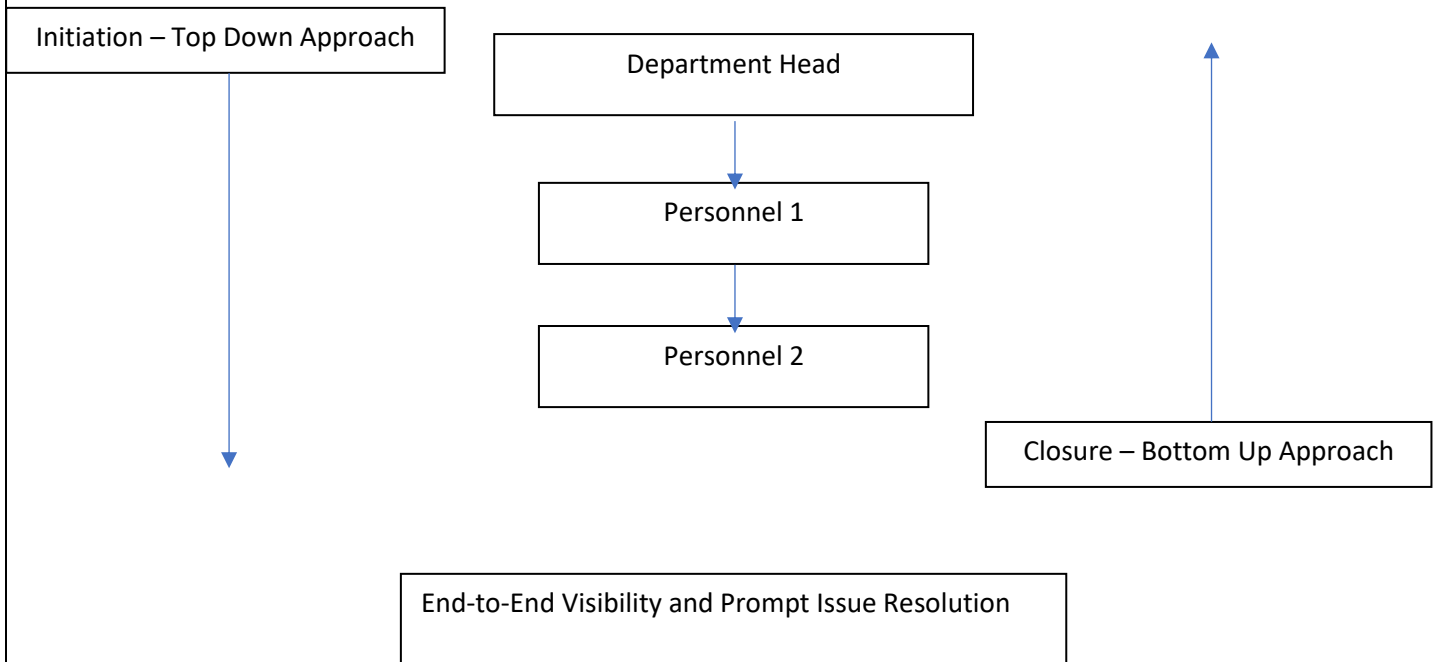

Following AI-based data extraction, an initial validation is performed by a designated human reviewer to ensure accuracy, completeness, and contextual correctness of the captured information. The reviewer verifies key fields such as project name, complaint details, complaint date etc. while also correcting any misinterpretations or filling in missing details where possible.

- **Mapping of issue with relevant department**

The reviewer maps the issue with the relevant department (Example – Legal, Quality, Operations etc.). Along with the department mapped to the issue, all the people who have been marked in the Email thread for monitoring and action should be kept in the loop and provided with the updates of the tracker irrespective of whether the issue directly pertains their department or not.

- **Routing of Escalations & Action Tracking**

**Note – Data privacy to be maintained and capturing of information out of the system to not be allowed**

Once the complaint is validated and recorded in the system, the application automatically triggers notifications to the relevant stakeholders based on predefined workflows and escalation matrices. This includes routing the issue to concerned authorities (Ex. ZCEO, ZOH, ZQH etc.) aligned with the project and complaint category.

The assigned authorities are responsible for reviewing the issue, initiating corrective actions, and ensuring timely resolution. They are required to update the tracker with key details such as actions taken, CBE (Completion best estimate) and ongoing progress updates.

The following escalation matrix to be followed -

**Escalation Matrix (Proposed)**

| Severity | Action Start | Action Completion       | RCA    | Closure |
|----------|--------------|-------------------------|--------|---------|
| Fatal    | 12 hrs       | As per agreed timelines | 24 hrs | 3 days  |
| Critical | 24 hrs       |                         | 48 hrs | 5 days  |
| Medium   | 48 hrs       |                         | 72 hrs | 7 days  |
| Low      | 72 hrs       |                         | 96 hrs | 10 days |

- **RCA and CAPA**

Once the issue has been assigned, the person to conduct RCA and identify the underlying cause of the escalation along with the chronological order of occurrence, post which the RCA and CAPA remarks to be entered.

The RCA and CAPA to be entered by the actionable person and then validated and approved by the concerned authority.

**Corrective Actions (CA)**

- Fix applied to the specific complaint
- Rectification measures completed on-site or in process
- Customer-specific resolution actions

**Preventive Actions (PA)**

- Process improvements or SOP updates
- Design modifications or quality enhancements
- Training or awareness initiatives
- Vendor accountability or contract changes

After RCA and CAPA is entered by the concerned person, AI should analyse the information and rephrase it in bullets for easier implementation in future, post validation by authorised user.

- **Customer Confirmation and Ticket Closure**

Upon completion of the corrective actions, the concerned higher authority reviews and validates the resolution, following which a soft closure is recorded in the system with status as Rectification completed, Awaiting customer closure. If approval is received from the customer, the case is moved to hard closure after attaching the confirmation record. In the absence of customer approval, the hard closure can be done in 2 alternatives as below.

1 If a re-escalation is not received in the mail thread within a certain timeframe, it can be treated as a hard closure.

2 The assigned zonal team can conduct a visit to verify the rectifications done, validate and go for the hard closure.

**Phase 2**

- **Advanced Analytics & Management Visibility**

The system provides comprehensive dashboards and advanced analytics to enable real-time visibility of escalations for senior management. Key metrics such as number of complaints received, category-wise distribution, average resolution time, SLA adherence, aging of open cases, and frequency of repeat issues are captured and displayed in an intuitive format. This allows leadership to monitor performance across projects, departments, and regions, and identify trends or recurring problem areas.
